## EDUCATION

<b>Rice University</b> <i>Master of Computer Science</i>	<b>Houston, TX</b> <i>Aug 2024 – Dec 2025</i>
<b>The Chinese University of Hong Kong</b> <i>Bachelor of Engineering, Computer Science – GPA: 3.9/4.0; First Class Honors</i>	<b>Shenzhen, CN</b> <i>Sep 2020 – May 2024</i>
<b>University of California, Berkeley</b> <i>Exchange Student, Electrical Engineering and Computer Science (EECS) – GPA: 4.0/4.0</i>	<b>Berkeley, CA</b> <i>Jan 2023 – May 2023</i>
<b>Core Courses:</b> Data Structures and Algorithms, Operating Systems, Software Engineering, Parallel Programming, Database Systems, Computer Security, Computer Networks, Full-stack Development, Computer Architecture, Compiler Construction.	

## WORK EXPERIENCE

<b>Alibaba Group   Software Engineer Intern</b>	Guangzhou, CN   May 2024 – Aug 2024
<ul style="list-style-type: none"><li>Designed and implemented a network diagnostic tool with various speed testing algorithms and high extensibility for UNet, a network stack based on <b>Chromium</b>. Simulated different network conditions using a <b>Flask</b> server, achieving an accuracy within 0.2 Mbps when benchmarked against system measurements on Windows and macOS devices.</li><li>Developed a smart IP address selection mechanism, resulting in a 15.5% increase in TCP connection success rate.</li><li>Designed a long polling fallback strategy for ServerPush in a long connection channel. Optimized resource usage and reduced retransmissions, achieving a 3% increase in message delivery rate under unstable network connection conditions.</li><li>Implemented an interface for the Apollo Player to use UNet for network requests. Integrated glue code to bridge <b>C++</b> and <b>C</b> interfaces to enable runtime addition of new virtual functions through class inheritance with minimal code changes.</li></ul>	
<b>Tuyoo Games   Backend Developer Intern</b>	Guangzhou, CN   Mar 2024 – May 2024
<ul style="list-style-type: none"><li>Performed schema optimization of a <b>Redis</b> database, reducing storage use by 14%.</li><li>Built a game server management application using <b>Tkinter</b> to allow one-click configuration live updates for planners.</li><li>Developed a proxy login tool using <b>FastAPI</b> to transfer user data between different production environments. Containerized the microservice with <b>Docker</b> and deployed it on <b>AWS</b> for scalability and independent deploy ability.</li><li>Automated server reboot process with secure permission isolation, lowering restart time by 3-minutes.</li></ul>	
<b>AIRS LAB   Research Engineer</b>	Shenzhen, CN   Jan 2022 – May 2023
<ul style="list-style-type: none"><li>Built a lexer, parser, syntax analyzer, and code generator to compile Oat language into optimized <b>LLVM</b> Intermediate Representation.</li><li>Designed efficient data structures for symbol table and enhanced the AST with type and scope information through semantic analysis.</li></ul>	
<b>Apartsa   Software Engineer Intern</b>	Shenzhen, CN   May 2021 – Oct 2021
<ul style="list-style-type: none"><li>Designed and developed a scalable front-end application with <b>Figma</b>, <b>React</b>, and <b>ANT Design</b>, creating a seamless user experience for over 2000 active users.</li><li>Implemented user data storage with <b>MongoDB</b> and conducted user authentication testing with <b>Postman</b> and <b>Charles</b>.</li><li>Improved routing API and integrated <b>OAuth</b>, reducing page-switching time by 32% and observed login time by 27%.</li></ul>	

## PROJECTS

<b>Rookie DB — A lightweight relational database management system in Java</b>
<ul style="list-style-type: none"><li>Developed a buffer pool manager with a LRU linked-stack to optimize memory usage and reduce disk access latency, resulting in a 33.3% improvement in buffer pool hit rate and 20% reduction in average query latency.</li><li>Introduced recovery mechanisms with write-ahead logging (WAL) to provide system crash recovery and durability guarantees, ensuring data integrity with a 0.001% failure rate during simulated crash recovery scenarios.</li><li>Designed and implemented a multigranularity locking protocol to enhance transaction concurrency and isolation levels, increasing concurrent transaction throughput by 40% while maintaining strict serializability.</li></ul>
<b>CUDA-Optimized File System — A GPU-accelerated Linux-like file system supporting</b>
<ul style="list-style-type: none"><li>Accelerated file IO speeds via <b>CUDA</b> multithreading for high-volume data processing.</li><li>Refined the data structure of the page table entry, reducing memory footprint of the page table by 50%</li><li>Optimized swap table and LRU counter with a linked stack, enhancing page swap efficiency by 95%.</li></ul>

## SKILL SUMMARY

<b>Programming</b>	C, C++, Python, Java, Javascript, TypeScript, Go, SQL, CUDA
<b>Web Dev &amp; Database</b>	HTML, CSS, React   MySQL, Redis, MongoDB, PostgreSQL   Node.js, Django, Flask, Spring Boot
<b>Cloud &amp; DevOps</b>	AWS, S3 API, Nginx, Apache Spark, Docker, Kubernetes, Git, Terraform, Jira, GitHub
<b>Miscellaneous</b>	Agile Software Development, Android, Jupyter, OpenMP, MPI, GDB, Linux Kernel, Unit Testing
